

**Amendments to the Specification**

Please delete the current Abstract of the disclosure and insert the following new Abstract:

A system and method are provided for delivering high performance video over point-to-point connections and shared multiple access networks, which also providing a way to control the video source. In one aspect there is a method of communicating with and controlling a video source by using different header types. For sending commands, a command header is used, for sending data, a data header is used and for providing a response to received commands, an answer header is used. In another aspect, there is a method of communicating data between a sender and receiver that includes identifying packets with an identifier and address so that a request for missing packets, including the address enables the sender to directly locate the missing packet without performing a search.
